Before you start: Preparing to do your Animal Waste Management Plan

There are a number of things that you should do before you start completing your plan.

✓ First, you should soil test any fields on your farm where you plan to spread manure.

✓ Second, sample the nutrient content of the manure in your manure storage. This program will automatically determine an estimate of manure nutrient content (N, P2O5, and K2O). However, this is determined by published values from a book. An accurate representative value of the manure on your farm will be better.

✓ It will be helpful to determine the slope of your fields. A short fact sheet describing how to estimate slope is under resources.

✓ Prepare a farm map.

✓ Please determine how many animals you have and how much they weigh.

✓ Estimate the amount and type of bedding you use.

✓ Find phone and address of your local Public Health officials.

All the fact sheets described below are in the Before You Start folder.

Benefits of Having Soil Tested
To apply optimum levels of manure or chemical fertilizers to your soil, it is necessary to know the existing pH and the availability of essential plant nutrients in the soil. Remember: Excess manure or chemical fertilizers or limestone can be as detrimental to plant growth as deficiencies of these nutrients.

The appropriate application of manure is not only agronomically desirable but is also economically prudent. Don’t buy fertilizers that your soil doesn’t need; invest in those nutrients that will bring about a growth/yield response.

Soil testing is an environmentally responsible practice. The improper application of fertilizer or other nutrient sources can lead to nitrate or phosphorus contamination of our water resources. By applying the most appropriate kind and amount of fertilizer at the proper time, you can ensure that you are "feeding" your plant-life and not polluting our environment. The Rutgers University Soil Testing Laboratory has a helpful website that will help you get started in testing your soils: http://njaes.rutgers.edu/soiltestinglab/.
(Please copy this into your internet browser). The two fact sheets about Soil Testing should also be useful:

- Soil Sampling Instructions - Field crops, Commercial Vegetables, and Fruits. This fact sheet comes from the Rutgers University Soil Testing Laboratory.
- Soil Testing Fact Sheet. A good overview.

**Manure testing is also suggested.** The Manure Sampling and Analysis fact sheet comes from the Rutgers University Soil Testing Laboratory and gives a very good overview of how to take manure samples for analysis.

**Determining field slope.** Probably the simplest way to determine slope is to contact your local Soil Conservation District office and see if they can print out a map of your farm. They can also help you determine the slope in individuals. You can do this on your own by going to this website and finding your farm: [http://websoilsurvey.nrcs.usda.gov/app/](http://websoilsurvey.nrcs.usda.gov/app/) (Please copy this into your internet browser).

- The fact sheet, Determining Slopes, presents some other techniques for slope determination.

**Making a farm map.** It will be helpful for you to draw a map of your farm that includes barnyard sketches for buildings, storages, streams, fences, etc. And also a map of fields that are included in the management unit. By management unit, I mean fields that animal use for exercise or grazing, or where manure is spread. Also please include streams, waterways, wetlands, etc. The simplest way is probably to get your local soil Conservation district to assist you in printing out a map for your farm. You can use the web survey described above: [http://websoilsurvey.nrcs.usda.gov/app/](http://websoilsurvey.nrcs.usda.gov/app/) (Please copy this into your internet browser).

In the Before You Start folder there is a fact sheet that include a hand-drawn barnyard map, a hand-drawn farm map, and blank copies for drawing your own.

**Animal Units.** Please determine before beginning how many animals you have on your farm, what species and what weight. This information will be useful as we calculate animal units, farm animal density, and manure production.

**Bedding use.** Please estimate before you start how much bedding, amount and type, you use on a regular basis.

**Public Health.** This emergency contact information is useful so you can contact for assistance in case of an emergency. County contacts are listed below.

All of the fact sheets on this page can be accessed from the Before You Start File on the CD or if you are working online.
Public Health Officers
Atlantic County
Department Of Human Services
Division Of Public Health
Hammonton Human Services Building
310 Bellevue Avenue
Hammonton, NJ 08037
